COVER LETTER

Subject: Application — AI Engineer

Dear Leadout team,

I spent over a decade in consulting and enterprise delivery — at Deloitte Digital and Accenture — on the engineering side but always close to the business conversation. I've sat with domain experts trying to articulate how their work gets done, and I've had to turn that into something buildable. That part of your role description felt familiar to me.

A few years ago I relocated from Germany to Belgium and took a deliberate break to look after my son until he started school. Returning to work was always the plan. What I didn't plan was that AI would arrive meanwhile — and I found myself genuinely pulled into it. I started building to stay current, and kept going because it was interesting. Six projects later — a multi-server MCP client, a private knowledge RAG assistant, a LangGraph multi-agent system — I've made the move into AI engineering properly.

I won't overstate where I am. These are independent projects, not enterprise deployments. But they're built to production-ready standards, and my consulting background means I already think about the business problem before I touch the technology.

I'm drawn to Leadout because the work is concrete — real domain expertise to capture, real workflows to automate, real use cases from day one. That's exactly the kind of environment I'm looking to work in.

Based in Antwerp, available immediately. CV and portfolio attached.

Kind regards,

Bhakti Kulkarni
